No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                           Sequence 2686, Application US/09949016
Sequence 2686, Application US/09949016
Patent No. 6812339
GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: FOLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          transmembrane
```

CC This sequence represents cDNA encoding a novel human protein, STRAP-1 CC (serpentine transmembrane antigen of the prostate). STRAP-1 is the CC prototype member of the STRAP family of proteins (AAY58194-Y58197) which CC exhibit a high degree of structural conservation, but which show no CC significant structural homology to known human proteins. The STRAP-1 gene CC lila membrane protein and is expressed predominantly in prostate cells in CC cornal human tissues. Structurally, STRAP-1 is a 339 amino acid protein CC caracterised by six transmembrane domains and intracellular N- and C-CC termini, suggesting that it folds in a "serpentine" manner into three CC extracellular and two intracellular loops. STRAP-1 mRNA and protein CC expression is maintained at high levels and throughout all stages of CC prostate cancer. STRAP-1 mRNA and/or protein is also overexpressed in CC certain other cancers, including bladder, colon, pancreatic and ovarian cancer. The function of the STRAP proteins is not known. They may be ion CC channels (from the presence of six transmembrane domains, a feature which is shared by certain ion channels) or gap-junction proteins (from the context of the strap context of the strap cancer are cell-surface tumour antigens. Immunisation with a STRAP protein induces cellular and

STRAP proteins may be used to identify specific-binding agents, to produce anticancer vaccines and to generate specific antibodies. The antibodies may be used for detection, prognosis, and monitoring of cancers (or susceptibility to cancer), as therapeutic inhibitors or to target therapeutic agents to their site of action. STRAP nucleic acids may be used for recombinant protein production, as diagnostic and prognostic reagents, for identifying STRAP-expressing cells for screening inhibitors of STRAP expression and for therapeutic modulation/inhibition of STRAP expression. Since high levels of STRAP proteins are exposed on the cell surface, they are easily targetted by systemically administered agents, and because they are expressed mainly on prostatic epithelial cells, agents targetted to them should have minimal side effects on other tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

The present sequence is human six transmembrane epithelial antigen of the prostate (STRAP): I clone 10 cDNA. STRAP is a member of cell surface serpentine transmembrane antigens. STRAP is a member of cell surface pp.22.3 and is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STRAP or inhibiting growth or killing cells expressing STRAP in a patient, comprises administering a vaccine composition to the patient. Treating a patient with a cancer that

Note: The present sequence is also shown in sequence listing of the specification, but it lacks nulceotides at its 5' end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1193 BP; 382 A; 219 C;

                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a composition comprising a substance that modulates the status of a protein (I) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins polynucleotides and methods are useful for treating and detecting cancer The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This sequence encodes a variant of human six transmembrane epithelial antigen of the prostate or STEAP-1
                                                                                                                                                                                                                                                                                                                       Sequence 1193
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition comprising a substance that modulates the status of STEAP-1-related protein, useful for treating and detecting cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           06-SEP-2001; 2001US-0317840P.

                                                                                                                                                                     The invention relates to cell surface serpentine transmembrane antigens predominantly expressed in the prostate termed as six transmembrane epithelial antigen of prostate (STEAP-2) and their corresponding nucleic acid sequences. STEAP-2 DNA is useful for diagnosing or treating prostate cancer. It can be used as a primer or probe for the amplification and/or detection of STEAP genes and as a tool for modulating or inhibiting the expression of the STEAP genes. STEAP-2 DNA is also useful in cancer vaccines for the generation of therapeutic or prophylactic immunity against prostate cancer. STEAP antibodies are useful in antibody therapy. The present sequence is the human STEAP-1 cDNA. Human STEAP-1 gene maps within chromosome 7p22 (7p2.3).
                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                   Novel isolated polynucleotide that encodes six transmembrane epithelial antigen of prostate polypeptide, useful for diagnosing or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (HUBE/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-JUN-1999;
